

This solution is at RWM exhibition, NEC Birmingham, Hall 4 – stand C50-D51 from 15-17 September 2015.

Make renewable and EFW plants more efficient with the global experience of Mitsubishi Electric

RWM exhibition, Birmingham, 15.-17.9.2015

Energy from Waste (EFW) plants around the world rely on automated systems from Mitsubishi Electric to optimise performance and ensure the maximum levels of efficiency while also achieving rigorous environmental standards for emissions.

Interest in EFW has never been higher. It is estimated that in the UK 17 per cent of the nation's demand for electricity could be met from EFW generation plants and that this would massively reduce the need for waste disposal in landfill sites. Further it would make a major contribution to recycling targets.

Mitsubishi Electric has a long history of supplying turnkey Electrical, Instrumentation and Control (EI&C) projects to power generation plant operators across all continents of the world. This includes cutting edge technology, design, installation, commissioning and maintenance.

As well as traditional power plants Mitsubishi Electric has supported Energy from Waste, biomass and other new and emerging solutions. Within its experience are biogas based generation at waste water facilities, electricity generation from steam turbines and district heating.

Mitsubishi Electric is using the RWM Exhibition (Birmingham, 15-17 September 2015, Hall 4 – stand C50-D51) to launch and showcase several innovative new solutions for the EFW industry, including the PMSX[®]micro, a control system developed specifically for smaller plants, and the Virtual Power Plant which uses cutting edge control technologies to create a stable energy network by automatically managing multiple renewable power plants to work together and meet real-time energy needs.

PMSX[®]micro is designed specifically for smaller scale applications. It runs on a single industrial computer and delivers proven control technology in an inexpensive and easily engineered package. Its integrated alarm and event system allows rapid responses to unexpected events and also records events and messages securely in sequence, allowing process flows to be traced in the event of problems or changes to the plant. Built-in maintenance functions and a range of analysis options help operators interpret process data and improve plant performance.

The Virtual Power Plant has been developed to meet the emerging need to integrate numbers of small green or renewable generation sites, such as solar, wind, wave, energy from waste, biogas, etc. While such sites can make a valuable contribution to the overall energy requirement, some tend to be non-constant in their operation. The Virtual Power Plant can monitor real time demand for power and co-ordinate the output of the generating sites to which it is networked to meet the demand at any point in time.

Also on show will be the powerful and flexible Mitsubishi Adroit Process Suite (MAPS), a life-cycle software tool that maximises values along the whole value chain. It is a single integration package that takes users

through all the stages of a power plant project from the initial process, engineering and control system design stages, through the installation, commissioning and acceptance testing stages, to operations and regular maintenance and then later upgrades and redevelopment projects.

Mitsubishi Electric has recognised that energy costs will continue to rise over the coming decades and that climate-related taxes will grow ever more burdensome as governments across the world strive to incentivise industry to reduce emissions. This has brought the issues of energy management and emissions reduction to the fore, not only in the generation industries, but across all sectors. While this is currently affecting energy intensive industries the most, it is inevitable that all businesses will have to periodically reassess their energy usage and energy management strategies.

Therefore Mitsubishi Electric has developed new technologies and solutions to make power generation, distribution and consumption far more efficient and environmentally friendly as possible. It is also maintaining world class development teams to constantly refine and enhance these technologies.

You can see examples of this work and talk to experts from Mitsubishi Electric at the RWM Exhibition (Birmingham, 15-17 September 2015, Hall 4 – stand C50-D51)

About Mitsubishi Electric

With over 90 years of experience in providing reliable, high-quality products to both corporate clients and general consumers all over the world, Mitsubishi Electric Corporation is a recognized world leader in the manufacture, marketing and sales of electrical and electronic equipment used in information processing and communications, space development and satellite communications, consumer electronics, industrial technology, as well as in products for the energy sector, water and waste water, transportation and building equipment.

With around 124.000 employees the company recorded consolidated group sales of 39,3 billion US Dollar* in the fiscal year ended March 31, 2014.

Our sales offices, research & development centres and manufacturing plants are located in over 30 countries.

Mitsubishi Electric Europe B.V., Factory Automation European Business Group (FA-EBG) has its European headquarters in Ratingen near Dusseldorf, Germany. It is a part of Mitsubishi Electric Europe B.V., a wholly owned subsidiary of Mitsubishi Electric Corporation, Japan.

The role of FA-EBG is to manage sales, service and support across its network of local branches and distributors throughout the EMEA region.
